## **Acknowledgment**

We are thankful to Dr. Kamal Poddar for explaining us the concepts of virtual instrumentation in a very lucid manner. We are very thankful to the lab assistants, Mr. Nitin and Mr. Rajesh, to make the lab available at almost all the times and helping us in any way possible to help us complete the project. The TA's, without whom the project would never have taken shape as it is now. We thank them for their continuous support in explaining us the details regarding the system and its working.

## Abstract

This project deals with object tracking of an object using the image acquisition module in the following three parts. For the first part, integration of two cameras helped us capturing an object in three dimensional space. Position of the chosen object has been captured in multiple frames in such way that its position and velocity could be found in a particular space frame. The second part gave us approximate coordinates to form a image using the frames captured. These coordinates are utilized to move a traverse through a motor, thus forming the third section to fulfil the objective.

## Introduction

Image Acquisition and Processing with LabVIEW combines the general theory of image acquisition and processing. The first step towards any kind of image processing is the acquisition of the actual images to be processed which can be obtained using a camera. It can be chosen between two main types of cameras - analog and digital. National Instruments high-speed image acquisition (IMAQ) devices provide up to 80 MB of onboard memory and they work with motion control and data acquisition hardware.

Some of the instruments used for this project are :

### (a) Stepper Motor:

Stepper motors move a known interval for each pulse of power. These pulses of power are provided by a stepper motor driver and is referred to as a step. When  $360^\circ$  of a circle is divided by the step angle gives the number of steps per revolution. Here, the  $360^\circ$  of the circle is divided into 20000 steps i.e. with one input pulse the motor will rotate  $0.018^\circ$ .

fig. Stepper motor (L) and its needle pointer that rotates (R)

### (b) Stepper Motor Driver:

The stepper motor driver used in this program is named as RMCS-1102, developed by Rhino Motion Controls. It designed for smooth and quiet operation without compromising on torque and control at higher speeds. It achieves micro-stepping using a synchronous PWM output drive.

The first 6 terminals of 12 are used for pulse and direction combination and the first 4 out of 8 switches are used for specifying different step resolutions. Tables (1) and (2) shows these terminals and switches respectively.

Terminal no.	Terminal name	Description
Terminal 1	ENA-	Enable(motor free) -ve optically isolated input
Terminal 2	ENA+	Enable(motor free) +ve optically isolated input
Terminal 3	DIR-	Direction -ve optically isolated input
Terminal 4	DIR+	Direction +ve optically isolated input
Terminal 5	PUL-	Pulse -ve optically isolated input
Terminal 6	PUL+	Pulse +ve optically isolated input

table (1): First 6 Terminals

Steps/rev	SW1	SW2	SW3	SW4
200	ON	ON	ON	ON
400	OFF	ON	ON	ON
800	ON	OFF	ON	ON
1000	OFF	OFF	ON	ON
2000	ON	ON	OFF	ON
3200	OFF	ON	OFF	ON
4000	ON	OFF	OFF	ON
8000	OFF	OFF	OFF	ON
1600	ON	ON	ON	OFF
6400	OFF	ON	ON	OFF
10000	ON	OFF	ON	OFF
12000	OFF	OFF	ON	OFF
12500	ON	ON	OFF	OFF

## VIs and Functions Used

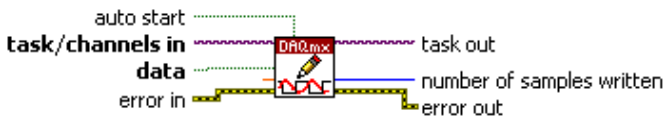

### (A) IMAQ functions used:

<u>Sr. No.</u>	<u>Name</u>	<u>Block</u>	<u>Function</u>
1	IMAQ find circles VI	 <p>The diagram shows the IMAQ find circles VI block. Inputs include Image Src (blue), Image Dst (green), Min Radius (orange), error in (no error) (yellow), and Max Radius (orange). Outputs include Image Dst Out (blue), Nb Circles (blue), Circles Data (blue), and error out (yellow).</p>	Separates overlapping circular particles and classify them based on their surface area, radius and perimeter.
2	IMAQ Threshold VI	 <p>The diagram shows the IMAQ Threshold VI block. Inputs include Keep/Replace Value (Replace) (green), Image Src (blue), Image Dst (green), Range (orange), error in (no error) (yellow), and Replace Value (orange). Outputs include Image Dst Out (blue) and error out (yellow).</p>	Applies threshold to a VI. Converts grayscale image to binary image.
3	IMAQ create VI	 <p>The diagram shows the IMAQ create VI block. Inputs include Border Size (blue), Image Name (blue), error in (no error) (yellow), and Image Type (blue). Outputs include New Image (blue) and error out (yellow).</p>	Creates a temporary memory location for image.
4	IMAQ Cast Image VI	 <p>The diagram shows the IMAQ Cast Image VI block. Inputs include # Shifts (blue), Image Src (blue), Image Dst (green), Lookup Table (orange), error in (no error) (yellow), and Image Type (blue). Outputs include Image Dst Out (blue) and error out (yellow).</p>	Converts the current image type to the image type specified by Image Type.
5	IMAQdx Open Camera VI	 <p>The diagram shows the IMAQdx Open Camera VI block. Inputs include Camera Control Mode (blue), Session In (blue), and error in (yellow). Outputs include Session Out (blue) and error out (yellow).</p>	Opens a camera, queries the camera for its capabilities, loads a camera configuration file, and creates a unique reference to the camera.
6	IMAQdx Close Camera	 <p>The diagram shows the IMAQdx Close Camera block. Inputs include Session In (blue) and error in (yellow). Outputs include error out (yellow).</p>	Stops an acquisition in progress, releases resources associated with an acquisition, and closes the specified Camera Session.

7	IMAQdx Configure Grab VI	 The diagram shows the IMAQdx Configure Grab VI block. It has two input terminals: 'Session In' and 'error in'. It has two output terminals: 'Session Out' and 'error out'. The block is represented by a small icon of a computer monitor with a play button.	Configures and starts a grab acquisition. Use the grab VI for high-speed image acquisition and to copy an image out of the buffer.
8	IMAQdx Grab VI	 The diagram shows the IMAQdx Grab VI block. It has four input terminals: 'Session In', 'Image In', 'Wait for Next Buffer? (Yes)', and 'error in'. It has three output terminals: 'Session Out', 'Image Out', and 'Buffer Number Out'. The block is represented by a small icon of a computer monitor with a play button.	Configures and starts a grab acquisition. Use the grab VI for high-speed image acquisition and to copy an image out of the buffer.
9	IMAQ Dispose VI	 The diagram shows the IMAQ Dispose VI block. It has two input terminals: 'All Images? (No)' and 'Image'. It has one output terminal: 'error out'. The block is represented by a small icon of a trash can.	Destroys an image and frees the space it occupied in memory.

### **(B) Data Acquisition blocks:**

<b><u>Sr. No.</u></b>	<b><u>Name</u></b>	<b><u>Block</u></b>	<b><u>Function</u></b>
1	DAQmx Create Channel	 The diagram shows the DAQmx Create Channel block. It has six input terminals: 'input terminal configuration', 'minimum value', 'maximum value', 'task in', 'name to assign', and 'units'. It has two output terminals: 'task out' and 'error out'. The block is represented by a small icon of a computer monitor with a play button.	Create virtual channel or set of virtual channels and adds them to a task.
2	DAQmx Timing	 The diagram shows the DAQmx Timing block. It has three input terminals: 'samples per channel', 'sample mode', and 'task/channels in'. It has two output terminals: 'task out' and 'error out'. The block is represented by a small icon of a clock.	Configures the number of samples to acquire or generate and creates a buffer when needed.
3	DAQmx Start Task	 The diagram shows the DAQmx Start Task block. It has two input terminals: 'task/channels in' and 'error in'. It has two output terminals: 'task out' and 'error out'. The block is represented by a small icon of a computer monitor with a play button.	Transitions the task to the running state to begin the measurement or generation.
4	DAQmx Stop Task	 The diagram shows the DAQmx Stop Task block. It has two input terminals: 'task/channels in' and 'error in'. It has two output terminals: 'task out' and 'error out'. The block is represented by a small icon of a computer monitor with a stop button.	Stops the task and returns it to the state the task was in before the DAQmx Start Task VI ran or the DAQmx Write VI ran with the auto start input set to TRUE.

5	DAQmx Write	 <p>The diagram shows a DAQmx Write block. Inputs include 'auto start' (green dashed line), 'task/channels in' (purple wavy line), 'data' (green dashed line), and 'error in' (yellow dashed line). Outputs include 'task out' (purple wavy line), 'number of samples written' (blue solid line), and 'error out' (yellow dashed line).</p>	Writes samples to the task or virtual channels you specify.
6	DAQmx Clear	 <p>The diagram shows a DAQmx Clear block. Inputs include 'task in' (purple wavy line) and 'error in' (yellow dashed line). The output is 'error out' (yellow dashed line).</p>	Clears the task.

## Block Diagrams

### 1) Image Acquiring VI

- Figure 1 shows the block diagram for image acquiring.
- This VI uses image acquisition functions to acquire, transmit, etc. the photographs of the object to be tracked.
- Using configure grab and grab, we acquire images continuously instead of using 'snap' directly because images would suffer from delayed input.
- We acquire coloured images and then using cast image we convert them from 32 bit to a 8 bit image.
- Now using threshold, we convert this to binary image in such a way that there would be at least a minimum and maximum threshold of 0 and 255 pixels respectively.
- To make things simpler, we have considered a black coloured background to ignore the filter usage.
- Using IMAQ find circle, this program identifies the image as a circular object of which we get an array of cluster containing its x and y coordinate, radius and its surface area.
- Using these coordinates, we plot the motion of the particle, viz., tracking.
- Using data socketing, the value get passed to another VI for motor control and traversing purpose.

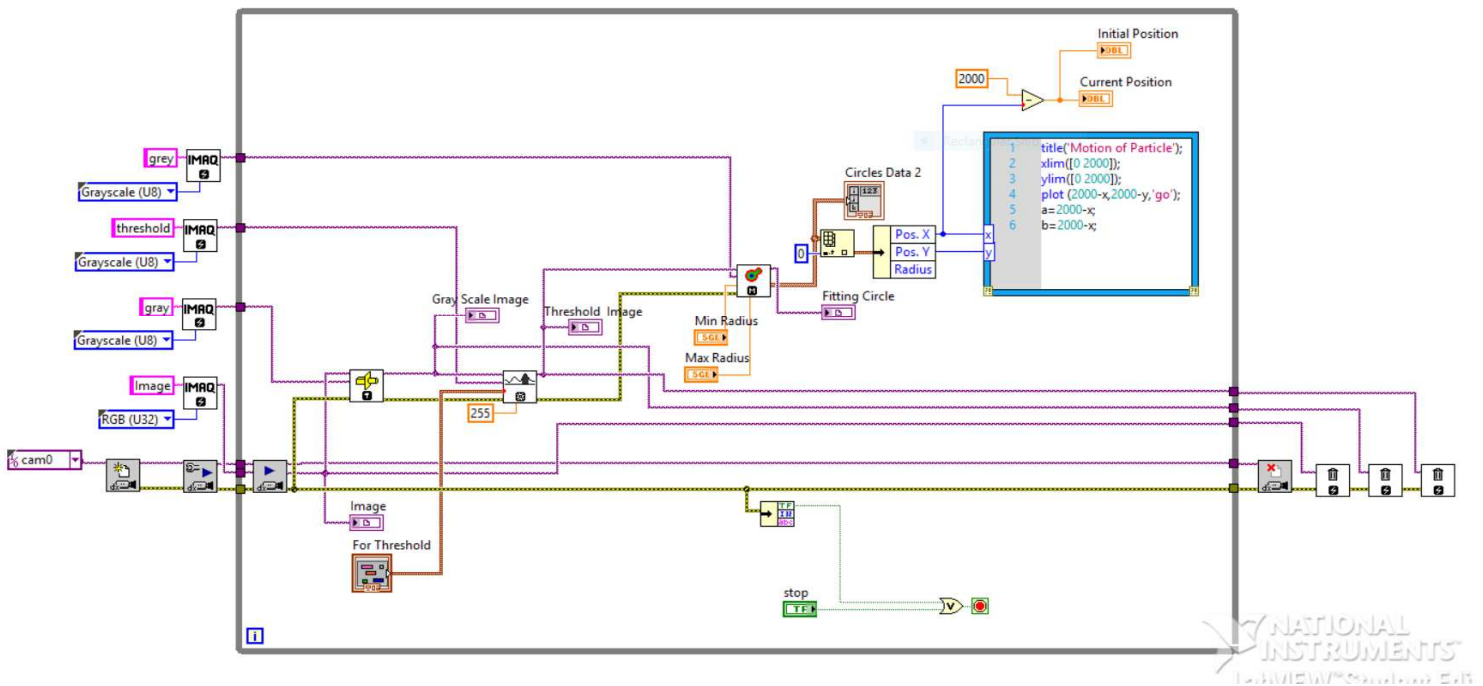

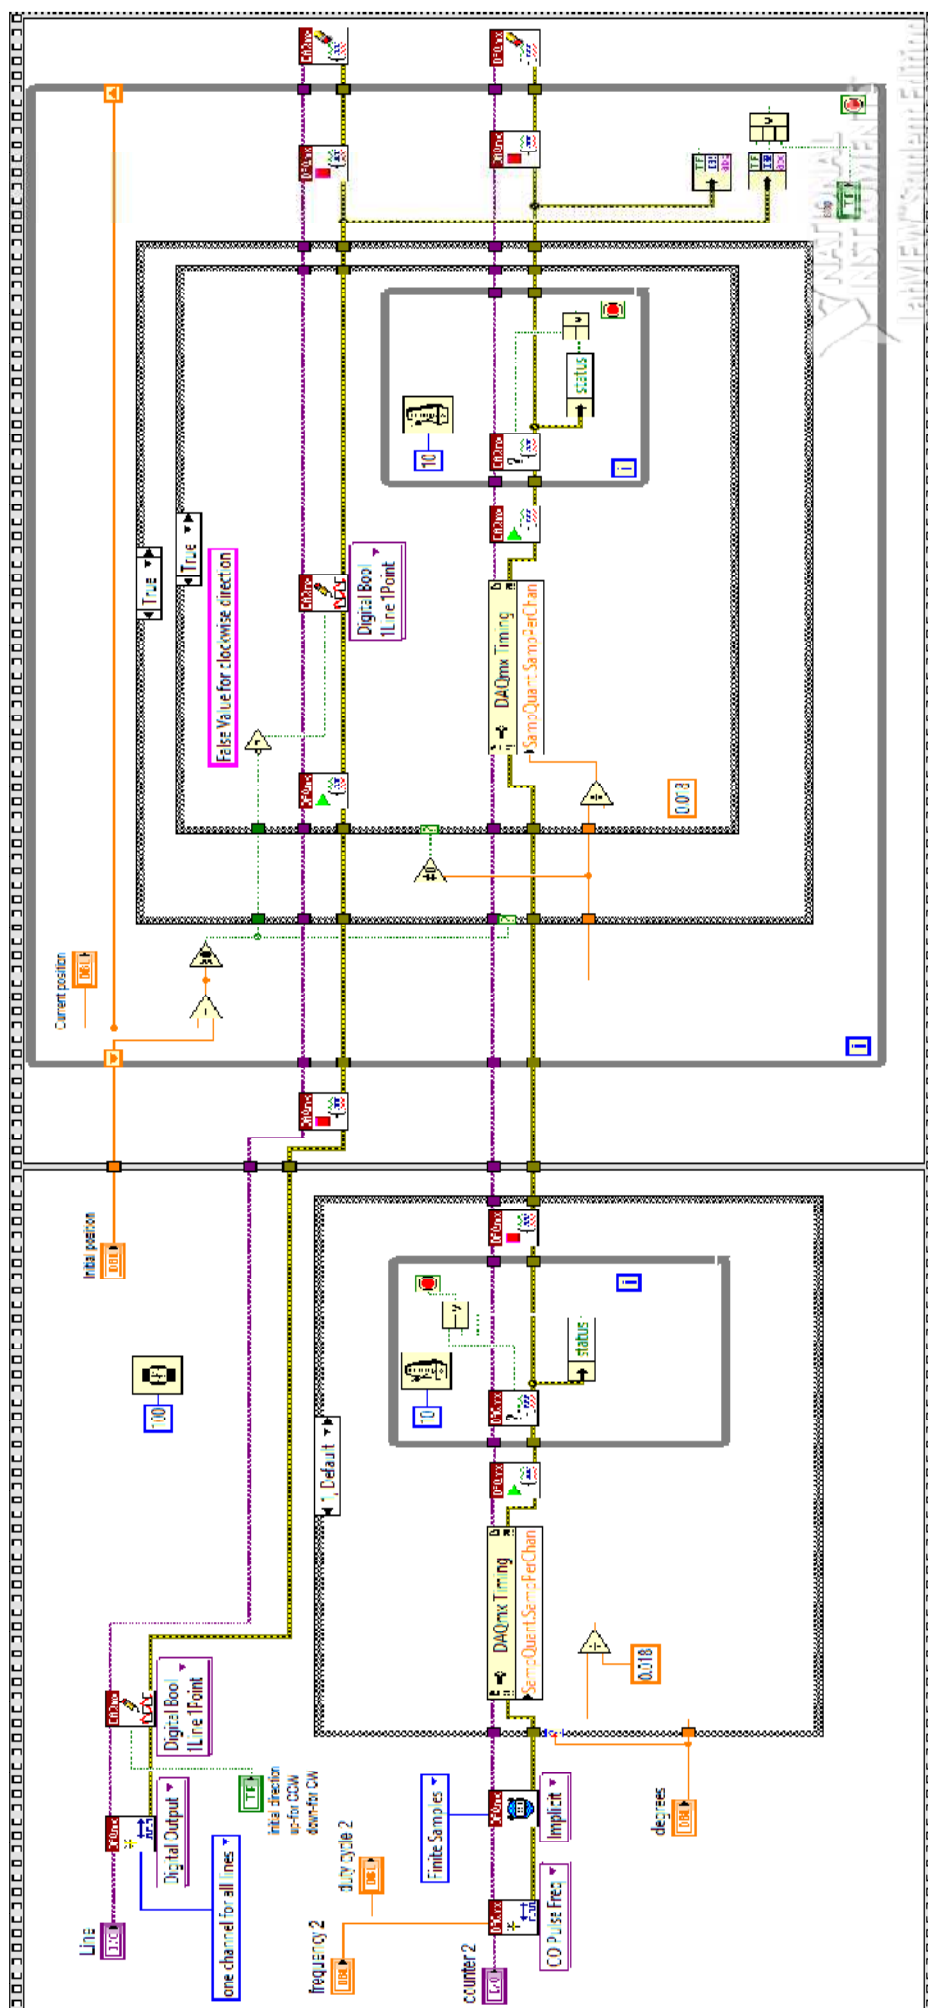

Figure 1: Block Diagram for acquiring continuous images and plotting its (x-y) motion in graph

## 2) Stepper VI

- Figures 2,3 and 4 shows the block diagram for stepper VI.
- This VI uses a stack sequence, three case structure and two while loops to initialize and process to obtain required results.
- Here, we initialized a digital line so as to give initial instructions to motor on how to rotate. It's clockwise when the switch is OFF and counter clockwise if it is ON.
- The stepper motor used has been given a setting of 20,000 steps per rotation. Hence, each step gives an accuracy of 0.018 degrees.
- Also, we initialize the stepper motor and bring it on zero position if it is not and we check whether the task has been completed. This is done in the first frame of the stacked sequence.
- Now the position of the object obtained via data socketing is compared with the initial position and if the difference is obtained, the motor starts traversing the object. It is to be noted that if positive difference is obtained, then the motor will run clockwise and if it is negative, it will run counter clockwise.
- The shift register will pass value of the previous object position obtained and it is subtracted from the new object's position.
- This process will continue till the difference becomes zero.
- Zero difference indicates the position that we were focused to achieve is reached, i.e., it has traversed the x position.

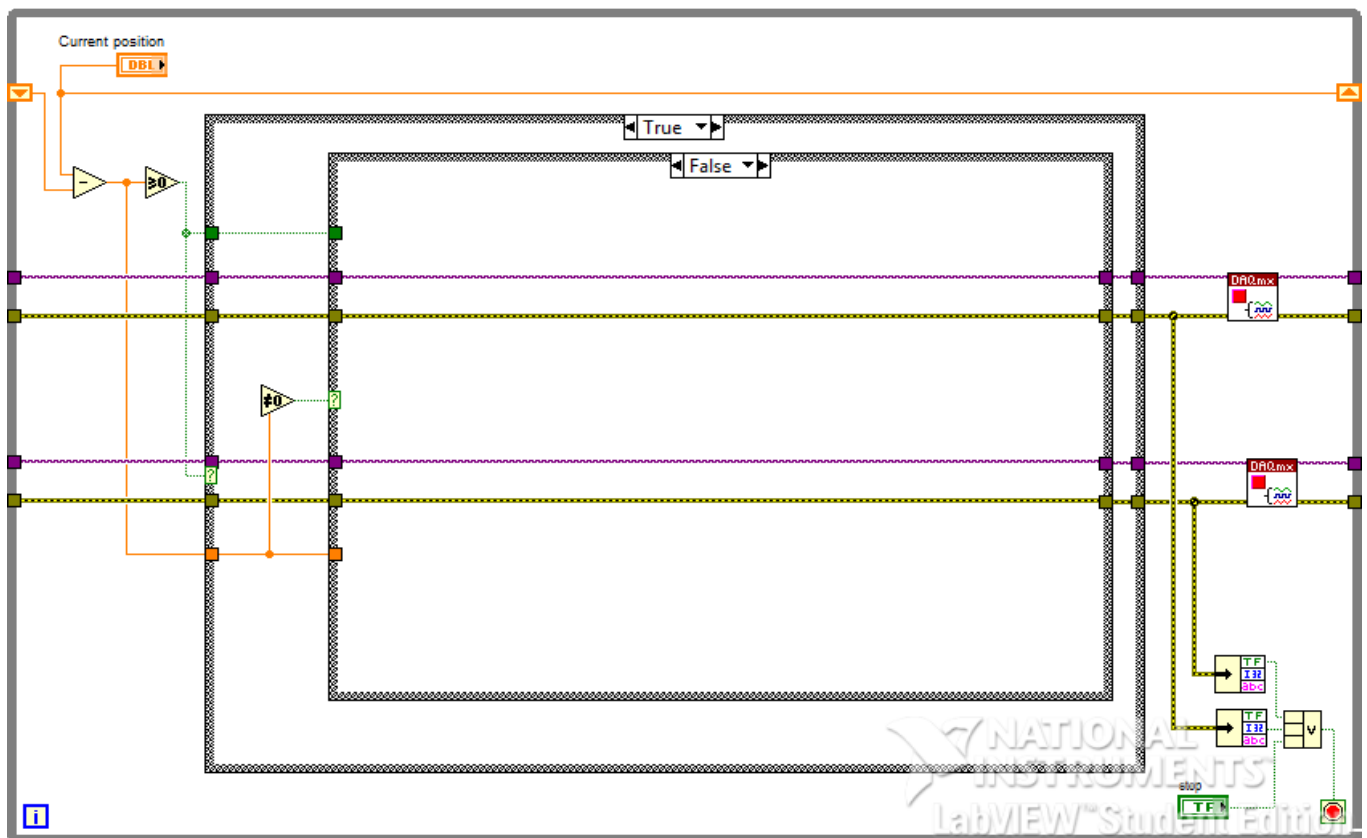

Figure 3: False Case of the second-case structure

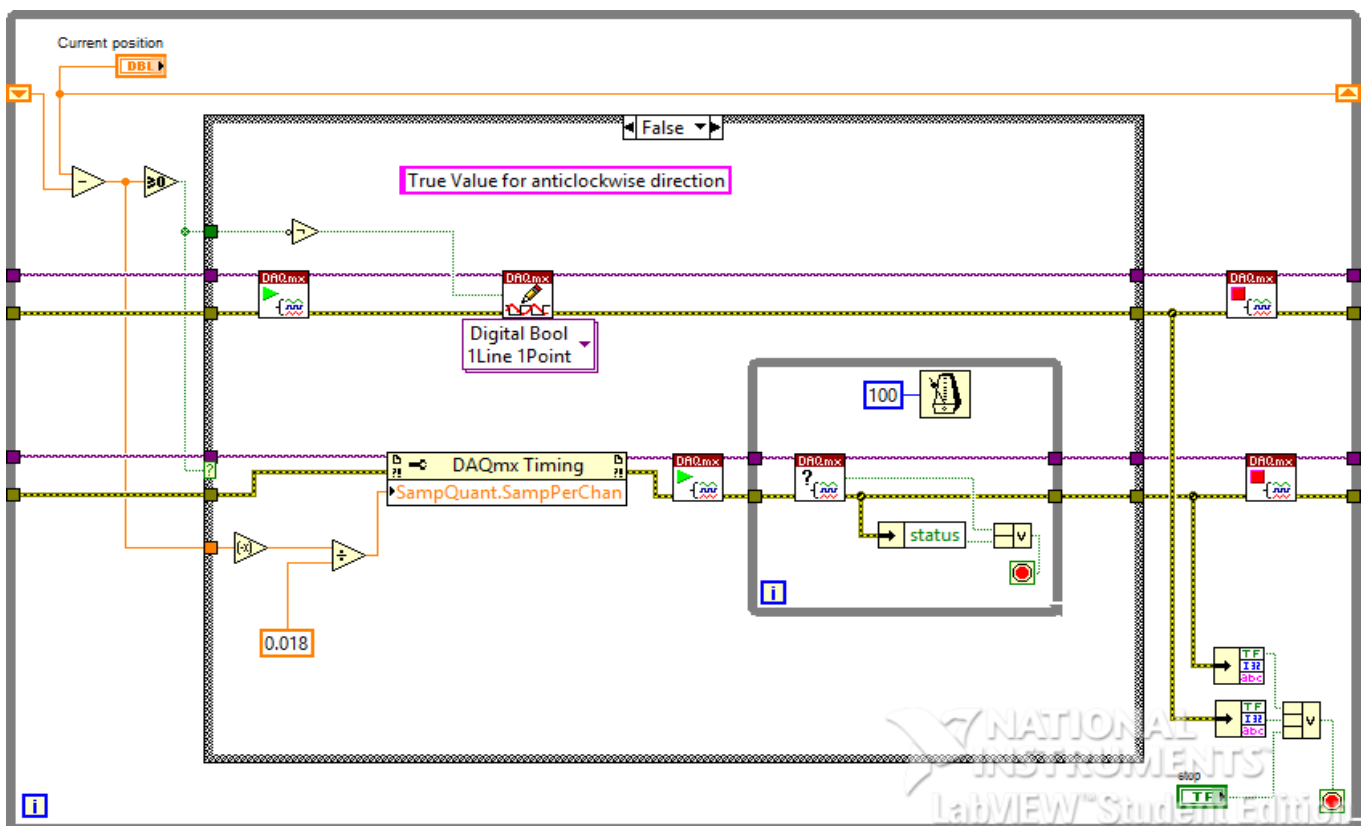

Figure 4: False Case of the First Case Structure

## **Future scope**

- This principle could be extended to three dimensional axes so that we can obtain any objects' mechanical action. This could then be used to obtain the size of the object and control the motion of any autonomous vehicle.
- Frequency of the motor which is given in revolutions per seconds can also be controlled depending upon the speed of the moving object.
